## Introduction the Project

Today, Covid-19 has affected the whole world. We have been fighting this disease for over a year. With the spread of the corona virus around the world, countries have revealed many restrictions and control channels. We see that the indexes of these restrictions are linked to the increase of corona virus. The effect of the increase in the numbers of the corona virus on the Government Response Stringency index rate. I will compare the number of cases from the day the corona virus started to spread until the end of April and the measures taken by the states and the level of these measures.

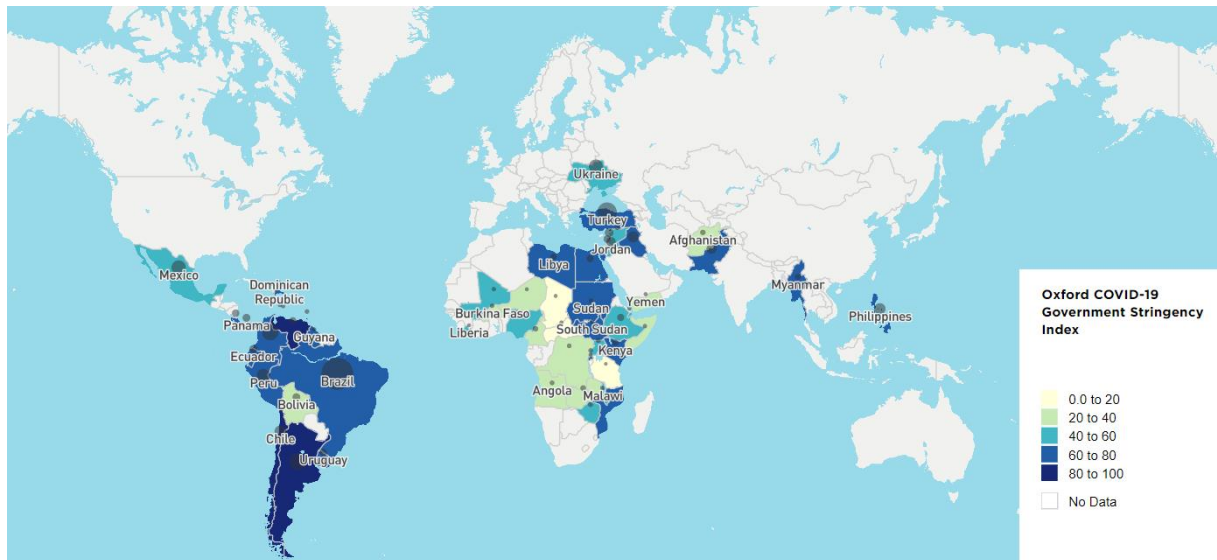

## Technical Details

I will use Google Data Studio and Google Chart, because I have change to use different graph, charts. Also they are free, and I can easily use these tools. I have two different datasets. First one is WHO Covid19 disease numbers and Other dataset is Government Response Stringency index rate. First one has 116131 files. Other has almost one million files. I collected this dataset with the number of cases in the countries until the end of April of the world health organization. In addition, I edited the data in the study conducted by the University of Oxford and made it the way I would use it. It took my time to create charts and charts that compare this data with the country-based numbers with the Google Chart application and the measure level until the end of April.

## Research Details

This map show that all corona virus cases and risk.I will compare to risk and government responsibility, and Stringency index.

This graph show that government responsibility and Stringency index.

I think if your country has high risk rate,your country Stringency index rate is high, because As the cases increase, countries take many measures to prevent these cases, so stringency rates are high.These prevention are closing close,and Workplace,events,airport,artisan etc.

I search top five on total corona virus cases.These are USA,India,Brazil,Turkey.

Firstly ı started to Turkey status.

#### Total Coronavirus Cases in Turkey

This table show that total coronavirus cases in Turkey. When the cases in the world increased in this picture, the rise was not that high in Turkey,but If precautions had been taken before the corona virus came to Turkey, the increase in cases in Turkey would not have been so intense.

This graph shows that Turkey's stringency index rate. We see that the Stringency index is irregularly distributed. We see that this uneven distribution also affects the increase in cases. For this reason, Turkey is in the fifth place in the world corona case table these days, and their economy has a problem, because their measures are irregular, so this affects all people in Turkey.

Secondly in this research we handle India, because India has more population than other top countries. They can have a problem when the Corona virus spreads to all population, so they detected this and they prevented this.

### Total Coronavirus Cases in India

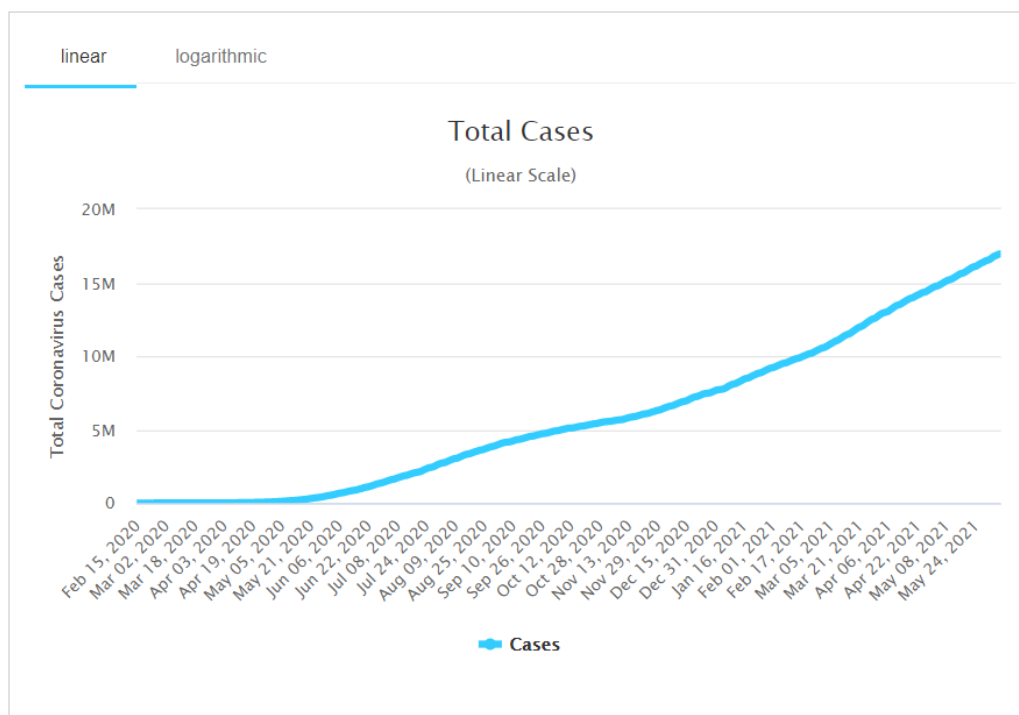

This graph shows that the total cases in India. We see that the measures affect the cases.

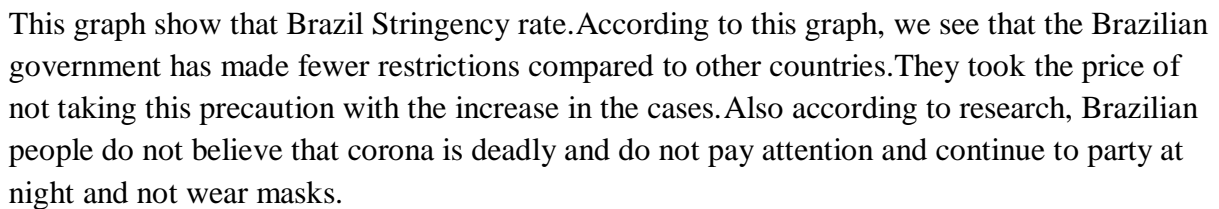

This graph shows that India's Stringency rate. India government took precautions in the early days and we can see this in the stringency index. This prevented the increase in cases in the early days.

Third one is Brazil. Brazil is third place on the corona virus cases list.

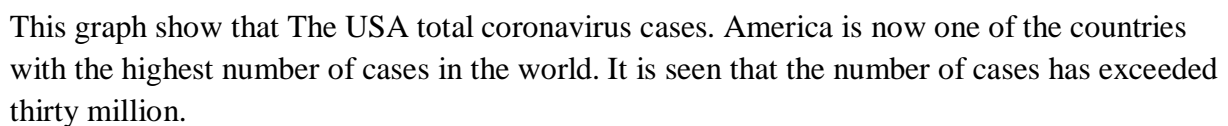

### Total Coronavirus Cases in Brazil

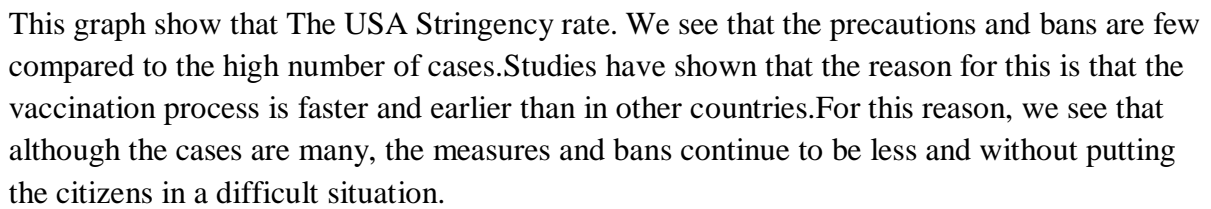

This graph shows that total coronavirus cases in Brazil. In this chart, we see that the Brazilian government does not pay attention to the corona and the rise is direct, and we find that there is no decrease.

## Total Coronavirus Cases in the United States

In pie chart We can see the percentile of cases in countries in the world.

## Project Result

I chose this topic because By taking precautions, the pandemic process can come to an end, and countries that consider the increase in cases can be more useful in the world health care and reduce the spread of the corona virus. For this reason, if countries take action against the corona, corona may end as soon as possible, and we can turn back normal life. We can act more socially and freely as before coronavirus.
